New porcine respiratory and reproductive disease virus - used to prepare vaccines and antibodies for diagnosis, treatment and prophylaxis of virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Primer; polymerase chain reaction; PCR; amplify; probe; Iowa strain; infectious agent; porcine respiratory and reproductive syndrome; ISU-12; vaccine; porcine respiratory and reproductive disease; PRRD; antibody;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequences given in AAQ63585-90 are primers which were used in the amplification of ORF-5, ORF-6 and ORF-7 of the infectious agent associated with the Iowa strain of porcine respiratory and reproductive syndrome, termed ISU-12. The isolated ISU-12 sequence may be used to infect cells and from these, the vaccine of the invention can be produced. This vaccine may be used for protecting pigs against a porcine respiratory and reproductive disease (FRRD). Antibodies to the vaccine may also be used in treating PRRD and for assaying for the virus.                                                                                                                                                                                                                                                                                                                                                                                                 AAT14322) of porcine reproductive and respiratory syndrome virus (PRRSV) low strain isolate 15U-12 (WR 2385). ORF-5 (AAT14390) was amplified using 2 other primers (AAT14399-9) and ORF-6 (AAT14390) using 2 further primers (AAT14400-02). Amplified fragments were closed into baculovirus transfer vector pVL1393 and used for prodn. of recombinant lows strain infectious agent proteins (ORF5-7 products, see also AAR94701-03) in Hi-Five insect cells. These proteins can be used in subunit vaccines against PRRSV in pigs. Primer AAT14403 was also used with primer AAT14400 to amplify the putative M and N genes of PRRSV isolates
                                                    Porcine reproductive and respiratory syndrome virus; PRRSV; vaccine; antigen; baculovirus; vector; Hi-Five; insect; polymerase chain reaction;
                                                                                                                                                                                                                                                                                                                       New porcine reproductive and respiratory syndrome virus DNA - and proteins encoded by open reading frames of an Iowa strain of the virus; are used in vaccines against PRRSV in pigs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              porcine reproductive and respiratory syndrome virus; PRRSV; antiviral; immunoprotective; vaccine; ISU-55; porcine reproductive and respiratory disease; PCR; primer; 88.
                                                                                                                                                                                                                                                                                                                                                                                        Primers (AAT14402 and AAT14403) were used to amplify ORF-7 (see also

Porcine Reproductive and Respiratory Syndrome Virus (PRRSV) DNA sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention relates to novel DNA and polypeptide sequences (ISU-55) of a porcine reproductive and respiratory syndrome virus (PRRSV). The invention may allow development of compounds with antiviral or immunoprotective activity or a vaccine. The ISU-55 polypeptides can be used to induce antibodies against PRRSV effective to induce the antibodies in a pig. Compositions comprising the ISU-55 polypeptides can be used as vaccines to protect pigs from a porcine reproductive and respiratory disease. The ISU-55 polypeptides can antibodies in pigs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     colon cancer; lung cancer; neurological disease; Huntington disease; spinocerebellar ataxia; viral disease; AIDS; apolipoprotein B; apoB; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                antilipemic; cardiant; vasotropic; antiarteriosclerotic; antidiabetic; cytostatic; anticonvulsant; nootropic; muscula; anti-HIV; RNA interference; iRNA; antisense technology; lipid metabolism; cholesterol imbalance; dyslipidaemia hypercholesterolaemia; coronary artery disease; CAD; coronary heart disease; CHD; atherosclerosis; hepatic glucose production; glucose-metabolism-related disorder; diabetes; cancer; breast cancer;

cone or more asymmetrical 2'-O alkyl modifications, the antisense sequences have one or more asymmetrical 19-O alkyl modifications, the antisense sequence and an antisense sequence, where the sense sequences have one or more asymmetrical phosphorothioate modifications and the antisense sequence targets a human gene sequence. Also described are: a pharmaceutical preparation comprising (1); reducing (M1) apo8-100 levels or glucose-6-phosphatase levels in a subject; producing (II); stabilising (I), involves selecting a sequence with activity and introducing one or more asymmetrical modification in the sequence, where the modification decreases nuclease sensitivity while not decreasing its activity; a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition comprising (I). (I) is useful for reducing apo8-100 levels or glucose-6-phosphatase levels. The subject is suffering from a disorder characterised by elevated or otherwise unwanted expression of apo8-100, elevated or otherwise unwanted expression of apo8-100, elevated or otherwise unwanted chocasterol, and/or disregulation of lipid metabolism. The disorder is chosen from the HDL/LDL cholesterol imbalance, dyslipidaemias, hypercholestorolaemia, statin-resistant cholesterolaemia, coronary artery disease (CHD), coronary heart diseases mentioned above, cancer (e.g.) breast, colon or inhibit hepatic glucose production or for treating glucose-metabolism-related disorder e.g. diabetes or type-2 diabetes. (I) is useful for realing the diseases as mentioned above, cancer (e.g., breast, colon or lung cancer), neurological diseases (e.g., AlDS). This sequence cor expression or for treating glucoses or production or for presents or production or for treating glucoses or colon or coronary artery disease (e.g., AlDS). This sequence or contracted to a subject to contract or spinocerebellar ataxia) or viral disease (e.g., AlDS). This sequence or contracted to a subject or contracted to a subject or contracted to a subject or 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Interference RNA agent useful for treating dyslipidemias, coronary artery disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention describes a RNA interference (iRNA) agent (I) comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 19 BP; 7 A; 4 C; 2 G; 6 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           can be used to control ApoB gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Example 5; SEQ ID NO 1006; 378pp; English

Human apolipoprotein B (ApoB) oligonucleotide segid 3950.

The invention describes a RNA interference (iRNA) agent (I) comprising a sense sequence and an antisense sequence, where the sense sequences have one or more asymmetrical prosphorothicate modifications and the antisense sequences have one or more asymmetrical phosphorothicate modifications and the antisense sequence targets a human gene sequence. Also described are: a pharmaceutical proparation comprising (I); reducing (M) apoble 100 levels or glucose-6-phosphatase levels in a subject; producing (I); exabilising (I), involves selecting a sequence with activity and interesting none or more asymmetrical modification in the sequence, where the modification decreases nuclease sensitivity while not decreasing its activity; a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition comprising (I). Is a useful for reducing apoble or glucose-6-phosphatase levels. The subject is suffering from a disorder characterised by elevated or cherwise unwanted expression of apoble). elevated or otherwise unwanted expression of apoble) elevated or otherwise unwanted expression of apoble). Evels of cholesterol, and/or disregulation of lipid metabolism. The disorder is chosen from the labellatical interest or cherwise unwanted expression of apoble). Interference RNA agent useful for treating dyslipidemias, coronary artery disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications. dyslipidaemias, hypercholestorolaemia, statin-resistant hypercholesterolaemia, coronary artery disease (GAD), coronary heart disease (CAD), coronary heart disease (CAD) and atherosclerosis. (I) is administered on subject to inhibit hepatic glucose production or for treating glucose-metabolism-related disorder e.g. diabetes or type-2 diabetes. (I) is useful for treating the diseases as mentioned above, cancer (e.g. breast, colon or lung cancer), neurological disease (e.g., Huntington disease or spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence Example 5; SEQ ID NO 3950; 378pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention describes a compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding phosphodiesterase 4D. The compound specifically hybridises with the nucleic acid molecule encoding phosphodiesterase 4D and inhibits the expression of phosphodiesterase 4D, or specifically hybridises with at least an 8-nucleobase portion of an active site on a nucleic acid molecule encoding phosphodiesterase 4D. The
represents a human apolipoprotein B (ApoB) antisense oligonucleotide that can be used to control ApoB gene expression.

coupled to an oligonucleotide which is complementary to the selected DNA and exposing the cell to light to cleave the DNA. Modulating the activity of a selected DNA comprises contacting the DNA with a PT coupled to an oligonucleotide which binds to the DNA and exposing the DNA-PT mixture to light to cleave the DNA. These methods can be used e.g. in cleavage of DNA in footprinting analysis, DNA sequencing, chromosome analyses, gene isolation, recombinant DNA manipulations, mapping of large genomes and chromosomes and for site-directed mutagenesis. They can also be used in responses that are caused by over expression of certain proteins, inflammatory infectious diseases and genetically-based disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes a method for determining the methylation status of CpG dinucleotides within the genes for oestrogen receptor, p21, p27, p16, progesterone receptor, myoglobin, pcna, ddc2, cerB2, p53 and/or CBA, which comprises contacting the target nucleic acid with a reagent that distinguishes between methylated and non-methylated CpG dinucleotides, and determining from the methylation status of the CpG positions the presence of a colon cancer. A set of oligomers or peptide nucleic acid (PNA)-oligomers can be used as probes for determining the cytosine methylation state and/or single nucleotide polymorphisms (SNP) of a corresponding genomic DNA by analysis of a chemically pretreated genomic DNA is useful for the determination of the methylation status of a corresponding genomic DNA is useful for the determination
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Determining methylation status of CpG dinucleotides using modified genomic sequences, oligonucleotides and/or PNA-oligomers, useful in the characterization, grading, staging and/or diagnosis of colon cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     p16; p53;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel method for detecting and differentiating between colon cell proliferative disorders associated with at least one gene or its regulatory regions. The method comprises contacting a target nucleic acid in a biological sample obtained from the subject with at least one reagent or a series of reagents, where the reagent or series of reagents of the invention demonstrate cytostatic acid. The molecules of the invention demonstrate cytostatic activity whilst the method may useful for detecting and differentiating between colon cell proliferative disorders, including cancers such as colon adenome and colon carcinoma. The PNA (peptide nucleic acid)-oligomers are useful as probes for polymorphisms. The current sequence is that of the hybridisation caliproliferation oligomorphisms. The current sequence is that of the hybridisation consideration which was used to analyse the genomic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Detecting and differentiating between colon cell proliferative disorders associated with a gene or its regulatory regions comprises contacting a target nucleic acid in a biological sample obtained from the subject with
of SNPs. The methods and pretreated genomic DNA are also useful for the characterisation, classification, diagnosis and differentiation of colon cell proliferative disorders. ACF62752 to ACF63278 represent sequences

The method comprises determining whether a human individual carrying a cyclin dependent kinase inhibitor 2A (CDRN2A) mutant allele also carries a melanocortin-1 receptor (MCIR) variant allele, where the presence of a MCIR variant allele indicates a predisposition of the individual to melanoma greater than that expected as a consequence of the CDRN2A mutant allele alone. Also disclosed is a kit for identifying a predisposition to melanoma. The kit comprises MCIR gene-specific primers and/or CDRN2A gene-specific primers and MCIR variant allele-specific comprises MCIR sequencing primers and MCIR variant allele-specific comprises MCIR sequencing primers and/or CDRN2A sequencing primers. The method is useful for identifying a predisposition to melanoma. The present sequence represents a sequencing primer that can be used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Identifying a predisposition to melanoma comprises determining whether an individual carrying a cyclin dependent kinase inhibitor 2A (CDKN2A) mutant allele also carries a melanocortin-1 receptor (MCIR) variant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Predisposition; melanoma; human; cyclin dependent kinase inhibitor 2A;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CDKN2A; mutant allele; melanocortin-1 receptor; MCIR; variant allele;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                recombinant chimeric protein (II). The protein consists of at least two mucleotide fragments, each encoding an epitopic region of at least one microorganism; at least one sequence encoding a linker, and at least one sequence encoding a binding region. The DNA and/or protein are used for in vitro diagnosis, especially of virus-related diseases, specifically HIV-1 or -2 infections. The protein is easy to purify and synthesise, and has strong immunoreactivity with sera from virus-infected subjects. The present sequence encodes hexalysine peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New recombinant DNA encoding chimeric protein, useful for in vitro diagnosis of viral infections, comprises sequences encoding epitopic regions, a linker and a binding region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

from which at least one peptide for presentation of MHC class I or class I molecules, or both, may be derived, and (b) a polypeptide portion, from which at least 1 peptide for presentation on MHC class I or class I come which at least 1 peptide for presentation on MHC class I or class II molecules, or both, may be derived. Also described in the present on the present at least 1 peptide for presentation on MHC class I or class II molecules or both, may be derived, and (b) a polypeptide portion from which at least 1 peptide for presentation on MHC class I or class II molecules, or both, may be derived, and (b) a polypeptide portion from comprising a recognition domain capable of targeting the molecule to an antigen presenting cell (APC), where the polypeptide portion does not comprise a specific antigen binding site. The molecules can be used to induce immune responses to treat or prevent, e.g. diseases caused by atthogenic organisms, cancers, viral disease, e.g. HIV or hepatitis infection, autoimmune conditions, e.g. disease, multiple conjunctivitis, attopic asthma or eczema. The combination of DNA and polypeptide in the same molecule can give rise not only to a combination of MHC class I - and MHC class II-mediated immune only to a combination of MHC class I - and MHC class II-mediated immune . The present sequence responses but also to an enhancement of these responses compared to the responses given by either DNA or polypeptide alone. The present sequence represents a PCR primer used in an example from the present invention

The invention relates to a method for the production of non-immunogenic proteins. The method comprises determining at least part of the amino acid sequence of the protein; (b) identifying in the amino acid sequence one or more potential epitopes for T-cells (T-cell epitopes) of the given species; and (c) modifying the amino acid sequence to eliminate at least one of the T-cell epitopes identified in step (b) thereby to eliminate or reduce the immunogenicity of the protein when exposed to the immune or system of the given species. A method of analysing a pre-existing protein to predict the basis for immunogenic responses is also provided. The methods can be used particularly for reducing the immunogenicity of immunoglobulins or therapeutic proteins, e.g. Streptokinase (SK). The products can be used for diagnosis and therapy. Sequences AAV81123-139 represent oligonucleotides used for the construction of chimeric 708 Vh
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Reducing immunogenicity of proteins - by modifying the amino acid sequence of the protein to eliminate potential epitopes for T-cells of a given species.

The method comprises determining at least part of the amino acid sequence of the protein; (b) identifying in the amino acid sequence one or more potential epitopes for T-cells (T-cell epitopes) of the given species; and (c) modifying the amino acid sequence to eliminate at least one of the T-cell epitopes identified in step (b) thereby to eliminate or reduce the immunogenicity of the protein when exposed to the immunospecies. A method of analysing a pre-existing protein to predict the basis for immunogenic responses is also provided. The immunoglobulins can be used particularly for reducing the immunogenicity of immunoglobulins on therapeutic proteins.

Products can be used for diagnosis and therapy. Sequences AAV81069-89 represent oligonucleotides used for the construction of vaccine 1 708 Wh
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method for the production of non-immunogenic
                                                                                                                                                                                                                                                                                                                                                                                                                     Reducing immunogenicity of proteins - by modifying the amino acid sequence of the protein to eliminate potential epitopes for T-cells of given species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ740 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the pharmaceutical agents acting on a disease as well as other treatment. N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 327, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the

                                                                                                                                                                       AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at postition 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention primers for the biallelic markers. The biallelic markers of the invention primers for the biallelic markers of the invention and we a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents methods, as well as the characterisation of the differential efficacious responses to and side effects from the charmaceutical agents acting a disease as well as other treatment.

AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymozphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ7740 represent amplification primers for the biallelic markers. The biallelic markers of the invention primers for the biallelic markers. The biallelic markers of the invention primers for the biallelic markers. The biallelic markers of the invention and apone, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaccutical agents and disagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from the marmaccutical agents acting on a disease as well as other treatment.

The present invention describes a short interfering nucleic acid (siNA) that downregulates expression of the SCD (stearoyl-CoA desaturase) gene by RNA interference. Also described: (1) modulating expression of SCD genes in cells, tissue explants or organisms by introduction of SiNA; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; and (4) vectors that express siNA. SCD inhibiting siNAs have anorectic, antidiabetic, antiatreriosclerotic, cytostatic virucide activities. The siNAs can be used to modulate expression of SCD genes, in cells, tissue explants or organisms, e.g. for treating obssity; clabetes (types I and II); atherosclerosis; cancer and viral infections. They can also be used for drug screening; diagnosis; target identification and validation; genetic engineering; pharmacogenomics; cudying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents an SCD siNA, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 short interfering nucleic acid; siNA; downregulation; inhibition; SCD; stearOyl-CoA desaturase; RNA interference; ancrectic; antidiabetic; antiarteriosclerotic; cytostatic; virucide; obesity; diabetes; theresclerosis; cancer; viral infection; drug screening;

                                                                                  The present invention describes a short interfering nucleic acid (siNA) that downregulates expression of the SCD (stearoyl-CoA desaturase) gene by RNA interference. Also described: (1) modulating expression of SCD genes in cells, tissue explants or organisms by introduction of SCD interference or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; and (4) vectors that express siNA. SCD inhibiting siNAs have ancretic, antidiabetic, antiarteriosclerotic, cycostatic and virucide activities. The siNAs can be used to modulate expression of SCD genes, in cells, tissue explants or organisms, e.g. for treating obesity, diabetes (types I and II); atherosclerosis; cancer and viral infections. They can also be used for drug screening; diagnosis; target studying gene function and validation; genetic emplaceming; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents an SCD siNA, which is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    short interfering nucleic acid; siNA; downregulation; inhibition; mitogen-activated protein kinase; MAP kinase; MAPK; RNA interference; cytostatic; anorectic; antidiabetic; antinflammatory; antiasthmatic; immunosuppressive; antibacterial; antirheumatic; antiarthritic; antipsoriatic; gastrointestinal; obesity; diabetes; tumour; inflammatory disease; asthma; septic shock; rheumatoid arthritis; psoriasis; inflammatory bowel disease; drug screening; genetic engineering; pharmacogenomic; gene mapping; ss.

that downregulates expression of a mitogen-activated procein kinase (MAPK) genes by RNA interference. Also described: (1) a method for modulating expression of MAPK genes in cells, tissue explants or organisms by introduction of siNA; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; and (4) vectors that express siNA and cells containing these vectors. MAPK siNAs have cytostatic, anorectic, antiabetic, antiablematory, antiathmitic, antipsoriatic and gastrointestinal activities. The MAPK siNAs can be used to modulate the expression of MAPK genes, in cells, tissue explants or organisms, e.g. for treating obseity; diabetes types I and II; a wide range of tumours, and inflammatory diseases (asthma, septic shock, rheumatoid arthritis, psoriasis and inflammatory bowel disease). They can also be used for drug screening; diagnosis; target dentification and validation; genetic engineering; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nuclectide polymorphisms). The present sequence represents a MAPK siNA which is used
                                                                                                                 present invention describes a short interfering nucleic acid (siNA)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         short interfering nucleic acid; siNA; downregulation; inhibition, mitogen-activated protein kinase; MAP kinase; MAPK; RNA interference; cytostatic; anorectic; antidiabetic; antiinflammatory; antiasthmatic; immunosuppressive; antibacterial; antirheumatic; antiarthritic; antipsoriatic; gastrointestinal; obesity; diabetes; tumour; inflammatory disease; asthma; septic shock; rheumatoid arthritis; psoriasis; inflammatory bowel disease; drug screening;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Mitogen activated protein kinase siNA oligonucleotide SEQ ID NO:552.
New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates expression of mitogen-activated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

(SIRN-) SIRNA THERAPEUTICS INC

ö

```
The present invention describes a short interfering nucleic acid (siNA) that downregulates expression of a mitogen-activated protein kinase (MAPK) genes by RNA interference. Also described: (1) a method for modulating expression of MAPK genes in cells, tissue explants or capanisms by introduction of siNA; (2) kits for in vitro or in vivo calivery of siNA; (3) conjugates and/or complexes of siNA; and (4) cellvery of siNA; (3) conjugates and/or complexes of siNA; and (4) certors that express siNA and cells containing these vectors. MAPK siNAs have cytostatic, anorectic, antidiabetic, antinflammatory, antiatheumatic, antiathmatic, antipsoriatic and gastrointestinal activities. The MAPK siNAs can be used to modulate the expression of MAPK genes, in cells, tissue explants or organisms, e.g. for treating obselty; diabetes types I and II; a wide range of tumours, and inflammatory diseases (asthma, septic shock, rheumatoid arthritis, psoriasis and inflammatory bowel disease). They can also be used for drug screening; pharmacogenomics; chentification and validation; genetic engineering; pharmacogenomics; cholymorphisms). The present sequence represents a MAPK siNA which is used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cytokeratin; CK; LAMP; loop mediated isothermal amplification; metastasis; prostate cancer; lymphoma; human; CK18; ss; primer;

The invention relates to a novel gene encoding a transglucuronidase (glucuronyltransferase) protein. The enzymes of the invention, DmGlcAT-1, DmGlcAT-PI and DmGlcAT-PII, and their encoded genes participate in the synthesis of the GAG (glucosaminoglycan) chain and HNK-1 epitope, both of which are particularly useful as reagents and in glycotechnology. The current sequence is that of the PCR primer of the invention which was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  used to amplify fruit fly transglucuronidase sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 19 BP; 5 A; 6 C; 4 G; 4 T; 0 U; 0 Other;

Best Local Similarity RNA interference. WO2004045543-A2. 09-SEP-2004 03-JUN-2004. Synthetic. 19 ADQ62378; Query Match Matches ò 셤 ö The invention relates to novel nucleic acid amplification primers for the detection of human cytokeratin (CK) 18, 19 or 20 expression by the LAMP (loop mediated isothermal amplification) method. The primers of the invention may be useful for the detecting cytokeratin 18-20 expression as an indicator for the diagnosis of tumour metastasis, particularly postate cancer and lymphoma. The amplification using the primers is highly efficient and allows very sensitive detection of tumour metastasis. The current sequence is that of the human CK18-derived DNA of transglucuronidase; glucuronyltransferase; GAG; glucosaminoglycan chain; HNK-1 epitope; glycotechnology; fruit fly; DmGlcAT-1; DmGlcAT-PI; DmGlcAT-PII; ss; PCR; primer; RT-PCR. Drosophila melanogaster-originated transglucuronidases and their encoded genes active in syntheses of GAG chain and HNK-1 epitope, useful as PCR primer SEQ 18 used to amplify fruit fly transglucuronidase sequence. Gaps LAMP nucleic acid amplification primers for detection of cytokeratin expression as indicator in diagnosis of tumour metastasis. ö 0.7%; Score 14.8; DB 1; Length 19; 88.9%; Pred. ```
The invention relates to a novel method for selecting siRNA (short interfering RNA) comprising selecting an siRNA molecule of 19-25 cucleoside bases by selecting a target gene and measuring the nucleoside bases by selecting a target gene and measuring the are functionality of sequences of 19-25 nucleotides in length that are functionality is dependent upon non-target specific criteria. Also claimed are methods for gene-silencing, developing an siRNA algorithm for selecting siRNA, selecting an siRNA, an siRNA molecule of fective at silencing Bcl-2, and a kit for gene silencing comprising the siRNA. The siRNA molecule comprises a sequence substantially similar to a sequence consisting AddusdusAddusAdus, and siRNA, and siRNA molecule consisting of GGGAGANGAUGANGUNGANGUN, GAAGACUCGUGCAUGAUGANG, GAAGACUCGUGCAUGAUGANG, CAUGCGGCCUCGUUGAUGANGUNU, GAAGACUCGUGCACANG, CANGCGGCCUCGUUGAUGANGUNU, GAAGACUCGUCGAUGANGUNU, CANGCGGCCUCGUUGANGUNU, GAAGACUCGCGCAGUU, The siRNA molecule comprises a mairpin. The siRNA molecule comprises between 18 and 30 base comprises a hairpin. The siRNA molecule comprises between 18 and 30 base pairs. The kit comprises at least two siRNA, comprising a first optimised siRNA for generating a gene silencing reagent. The present sequence is used in the exemplification of the invention.

The invention relates to identifying an individual who has altered risk for developing myocardial infarction comprises detecting single mucleotide polymorphism (SNP) in any one of the 41336 nucleotide nucleotide polymorphism (SNP) in any one of the 41336 nucleotide cardia, where the presence of the SNP is correlated with an altered risk for acids, where the presence of the SNP is correlated with an altered risk for myocardial infarction in the individual. Also included are an isolated nucleic acid molecule (comprising at least 8 contiguous cucleotides where one of the nucleotides is an SNP as cited above, or their complement), an isolated polymeptide comprising an animo acid sequence selected from any of the 636 animo acid sequences not defined in the specification, an antibody that specifically binds to the polymeptide comprising or the specification, an antibody that specifically binds to the polymeptide containing the SNP as cited (where the amplified polymucleotide is between about 16 and about 1,000 nucleotides in length), an isolated polymucleotide which specifically bybridises to a nucleic acid molecule containing the SNP, a kit for detecting a variant polymeptide and identifying an agent useful conformatically treating myocardial infarction.

The detection step of the method is carried out by a process selected from allele-specific probe hybridisation, allele-specific probe hybridisation, allele-specific probe hybridisation, allele-specific probe hybridisation, allele-specific maplification assay, oligonucleotide ligation assay, size analysis, and single-stranded conformation polymorphism. The method is carried in the specific probe myllication and are sequenced is common primer (used with an allele specific PCR primer) used to amplify an SNP-containing region from a myocardial infarction. The present sequence is common primer (used with an allele sequence are contained on a CD-R named CL001509CDR which has not the specification. Claim 19; SEQ ID NO 43964; 139pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to isolated RNAs comprising an intron RNA that is released in a cell, thus modulating the function of a target gene. Also disclosed is a DNA template for the isolated RNA, an expression vector comprising the DNA, and a composition comprising one or more agents that induce RNA-mediated modulation of the functions of two or more target genes in a cell, such as a mammalian cell. The isolated RNAs and compositions are useful for modulating the function of a target gene in a cell, e.g. to inhibit a cancer-related gene, potential viral gene, and microbe-related gene, and thus useful for treating and preventing diseases such as cancer and viral/microbial infections. The current RNA intron.
                                                                                                                                                                                                                                                                                                                                                                                                                                                        5. .17

The specification describes antisense oligonucleotides (AAX52869-X55271)

directed against at least 2 mRNAs selected from target genes, coding and
non-coding regions of RNAs corresponding to target genes, coding and
codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
codons, genomic flanking regions and all segments of RNAs encoding proteins associated with one or more diseases,
conditions or mixtures. The antisense oligonucleotides may be derived
from sequences AAX55272-74. These multiple target oligonucleotides
conditions or mixtures multiple target oligonucleotides
from sequences AAX55180-271) can be used for the antisense treatment of
diseases and conditions. Typical diseases and conditions are those
associated with impaired respiration and inflammation, including lung
diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
acute asthma, allergies, asthma, impeded respiration, respiratory
diseases (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g.

```
The present invention describes a new composition comprising an antisense cligomucleotide (ON) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiniflammatory, antiallergic, antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating e.g. ischaemic conditions, pulmonary vasconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive pulmonary diseases (CODD), and cancers such as leukaemias, lymphomas, carcinomas, and cancers which may metastasis to the lungs, including or seduces which may metastasis to the lungs, including or release of deoxyadenosine which activates adenosine receptors causing bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the nucleotide sequences given in the sequence listing from the present convention, which correspond to SEQ ID NO:1 to 2815, and then the last 185 sequences are also called SEQ ID NO:1 to 2815, but the sequences differ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            antiallergic; antiasthmatic; cytostatic; analgesic; impaired airway; lung disease; ischaemic condition; pulmonary vasoconstriction; asthma; respiratory distress syndrome; pain; cystic fibrosis; emphysema; pulmonary hypertension; chronic obstructive pulmonary disease; COPD; cancer; leukaemia; lymphoma; carcinoma; metastasis; ss.

ö Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions. human; airway disorder; bronchoconstriction; lung inflammation;
surfactant depletion; respiratory; bronchodilator; antiinflammatory;
immunosuppressive; antiasthmatic; analgesic; hypotensive; cytostatic;
respiratory obstruction; pulmonary obstruction; impeded respiration;
surfactant hypoproduction; pulmonary vasoconstriction; asthma; RDS;
respiratory distress syndrome; pain; cystic fibrosis; allergic rhinitis;
pulmonary hypertension; emphysema; pulmonary transplantation rejection;
chronic obstructive pulmonary disease; pulmonary infection; bronchitis; The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antinflammatory, analgesic, immunosuppressive, antisthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with lung/respiratory disorders and malignancies, such as stimulating and activating peptide factors and transmitters, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adhesion molecules and their receptors, cytokine and from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to AAA33929) are specifically claimed ONs from the present invention. N.B. Sequences given in the disclosure of the present invention do not match up with their corresponding SEQ ID NO: sequences given in the sequence Gaps Low adenosine antisense oligonucleotide; phosphorothioate; allergy; ö Score 14.4; DB 1; Length 16; Pred. ```
chemokine receptors, adenosine receptors, bradykinin receptors, central nervous system (CNS) and peripheral nervous and non-nervous system receptors. CNS and peripheral nervous and non-nervous system peptide transmitters, defensins, growth factors, vasoactive peptides and receptors, binding proteins and malignancy associated proteins. The antisense oligomucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or surfactant hypoproduction which are associated with a disease or condition selected from pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary hypoproduction emphysema, chronic obstructive pulmonary disease (COPP), bypertension, emphysema, chronic obstructive pulmonary disease (COPP), cullmonary transplantation respication, pulmonary infections, bronchitis, and/or cancer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequences AAS56729-AAS56968 represent DNA encoding BRCA-1 regulators, ribozyme target recognition RNA sequences, DNA fragments encoding the RNA and primers used in the methods of the invention. Hybridisation of ribozymes to their targets results in cleavage of the RNA target. The ribozymes can be used to cleave regulators of the tumour suppressor BRCA-1, resulting in upregulation or downregulation of BRCA-1 in a cell. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; BRCA-1 regulator; ribozyme; BR1; RNA target recognition; probe; cytostatic; RNA cleavage; tumour suppressor; PCR primer; CHLR2; AF6; BR2; inhibitor dominant negative 4; breast basic conserved protein 1; BBC1; BR3; ID4; cancer; proliferative disorder; tumour proliferation; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 specific and simultaneous detection of the main fourteen CYP450 (cytochrome P450) isoforms and to new primers specific for the probes. The probes and primers are useful for detecting CYP450 isoforms and for evaluating the toxicity or pathogenicity of a product and predicting drug in vivo interactions or efficiency. Sequences ABZ58615-642 represent specific examples of the primers specific for the CYP450 cDNA probes
              dominant negative 4 (ID4), breast basic conserved protein 1 (BBC1), CHLR2, AF6, BR2 and BR3. Regulation of BRCA-1 is useful for treating and diagnosing cancer and other proliferative disorders. The severity of an incidence of cancer can be lessened by regulating tumour proliferation through modulation of BRCA-1 expression. The sequences of the invention are useful in the development of anti-cancer drugs
targets include those encoding the BRCA-1 regulator BR1, inhibitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (CYP450)

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or WPI; 2003-229219/22.

Disclosure; SEQ ID NO 11114; 872pp; English.

ubiquinone.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation coodon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallargic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a cust in antiasnes gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing bronchoconstriction, understand producing bronchoconstriction, and subject is tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences

t 0 oligonucleotide containing less percentage of adenosine, targeted t nucleic acids associated with lung airway or lung dysfunction, and Pharmaceutical composition for treating asthma, has antisense bronchodilating agent.

Claim 15; SEQ ID NO 11114; 763pp; English.

This invention describes a novel composition, a) a first active agent, comprising oligomucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and bronchoconstriction, respiratory tract inflammation, allergies and constitution adeplation or hyposecretion, when administered to a mammal. The oligomucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction are describes a kit, that comprises: (a) a delivery or lung dysfunction are containers, (b) the oligomucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallargic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or treating a respiratory, lung or malignant disease. The administered composition of the target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung treduce the amount of target polypeptide present in the lungs. The cultifammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, cinflammation, allergies and/or bronchoconstriction and/or lung distress syndrome, pain, cystic fibrosis, allergic rhinitis, present in the target RNA serves to prevent the breakdown of transplantation rejection, pulmonary infections, bronchities or cancer. Thymidines present in the target RNA serves to prevent the system computed effects due to it tesue environment and thereby, to prevent any unwanted effects due to it This invention describes a novel composition (a) a first active agent, ABD19138

The invention relates to a mammalian PG1 gene and protein, and a set of PG1 biallelic markers. The PG1 polymuclectide and biallelic markers are used in a hybridisation assay, a sequencing assay, or in an allele specific amplification assay for determining the identity of a nucleotide at a PG1-related biallelic marker. The methods can be used to detect and to assass the risk of developing cancer or prostate cancer. Early-stage diagnosis of prostate cancer relies on prostate specific antigen (PSA) dosage. However, the effectiveness of this is limited due to its inability to discriminate between malignant and non-malignant affections of the organ. A need exists for both a reliable diagnostic procedure which would enable early-stage diagnosis, and for preventative and detection of prostate cancer, and the risk of developing it in the future, and can also be used to determine therapies for the disease
                                                                                                                                                                                                            PG1 gene; biallelic marker; PCR primer; PG1-related biallelic marker; cancer; prostate cancer; diagnosis; therapy; prostate specific antigen;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Use of a prostate cancer associated gene and biallelic markers derived

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fims-like tyrosine kinase 1 (fll-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour anglogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAXG775 to AAX7572 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor; foetal liver kinase 1; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                    Gaps

The invention relates to enzymatic nucleic acid molecules that down carginate expression of chloride channel calcium activated 1 (CLCA1) genes or regulate expression of chloride channel calcium activated 1 (CLCA1) genes by cleaving RNA derived from the genes. The nucleic acid sequences are useful as pharmaceutical agents for treating conditions such as chronic cobstructive pulmonary disease (CDPD), chronic bronchitis, asthma, cystic fibrosis, obstructive bowel syndrome and any other diseases or conditions to that are related to or will respond to the levels of CLCA1 in a cell or tissue. The sequences are useful for reducing CLCA1 activity in a cell, chence, are useful for treatment of a patient having a condition associated with the level of CLCA1, where the invention further comprises to the use of one or more therapies under conditions suitable for the creatment, for example, oxygen therapy, bronchodilators, corticosteroids, antibacterials, vaccinations, acetylcysteine and mucokinetic agents. The combacterials acids of the invention are also used as diagnostic tools to condition and presence of CLCA1 RNA in a cell. This sequence represents an exymmatic nucleic acid molecule of the invention
                                                                                                                                                                                                                                                                                                                                                                 channel calcium activated gene, useful for treating Chronic obstructive pulmonary disease (COPD), chronic bronchitis and asthma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WNV; West Nile Virus; antiinflammatory; cytostatic; hepatotropic; virucide; neuroprotective; antibacterial; replication; pancreatitis; encephalitis; myocarditis; meningitis; infection; hepatitis; liver failure; cancer; cirrhosis; Hammerhead; Inozyme; DNAzyme;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A method has been developed for detecting the presence or absence of a single nucleotide polymorphism (SNP) allele in a genomic sample. The method comprises preparing a reduced complexity genome (RCG) from the genomic sample and analysing the RCG for the presence or absence of a SNP allele. The method can be used to characterise a tumour, to generate a genomic pattern for an individual genome or to generate a genomic classification code for a genome. The method can be used to assess whether a subject is at risk for developing a disease or to identify a set of SNP alleles associated with a disease. The method can also be used to perform linkage analysis. AAA35944 to AAA35947 represent sequences used in the exemplification of the present invention. AAA35948 to

```
The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encaphalitis, mayocarditis, meningitis, neurologic infection, hepaticis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2'-O-methyl modifications, phosphorothicate linkages on at least ten 2'-O-methyl modifications, phosphorothicate linkages on at least three of the 5' terminal nuclectides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                New nucleic acid molecule that modulates replication of West Nile Virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WNV; West Nile Virus; antiinflammatory; cytostatic; hepatotropic; virucide; neuroprotective; antibacterial; replication; panoreatitis; encephalitis; myocarditis; meningitis; infection; hepatitis; liver failure; cancer; cirrhosis; Hammerhead; Inozyme; DNAzyme;
                                                                                                                                                                             (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, mocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2.0-methyl modifications, phosphorothioate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed, however, SEQ ID NO 2194-2206 and 17502-17514 are not given molecule of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ó;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

             The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of hammerhead, inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least then 2'-O-methyl modifications, phosphorothicate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given molecule of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HBR2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HBR2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HBR2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.
                                                                                                                                                                                                                                                                                                                                                                  Gaps

The expression or activity of (I) is modulated to modulate a plant growth trait in a flowering plant, of the family Brassicaces, preferably in a plant that is Arabidopsis, Brassica, Zea, Oryza, Triticum, Hordeum, Lollum, Sorghum, Glycine, Medicago, Helianthus, Lactuca, Beta, Vitis, Solanum, Lollum, Gossypium, Hevea, Linum, Prunus, Citrus, Populus, Pinus, or Quercue. A new method is used to detect genes for a plant growth trait. This sequence represents a polynuclectide isolated from the plant growth associated genes of the invention that can be used a sequence.
bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ59889 - ABZ65216, ABZ64544 - ABZ65531, ABZ66520 - ABZ66524, ABZ66530 - ABZ66585 represent substrate/target sequences for the human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated or recombinant polypeptide for use in modulating a plant growth trait in a flowering plant e.g. in Arabidopsis, Brassica, Zea, or

The method is very general, quick and easy to do. It can detect material from a species even when present in small amounts in presence of materials from several other species the species being tested do not have to be known a priori. DNA was isolated from an animal sample and amplified by PCR using two primers. The amplicon, containing a promoter for RNA TY polymerase (present in one ribonucleocide, then transcribed with incorporation of a fluorescent ribonucleocide, then transcripts cleaved to fragments of 20 nucleotides. These were tested for hybridisation to a DNA chip carrying 17-mer capture probes, specific for different animal species. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                       Determining origin of an animal sample, useful e.g. for detecting adulteration of food, by testing hybridization of sample DNA with set of

The present invention describes a method (M1) for aiding in the diagnosis of glioma. (M1) involves detecting an expression product of at least one gene (I) in a first brain tissue sample (T) suspected of being neoplastic, where (I) is chosen from any one of 255 genes (glioma comparing the expression of (I) in (I) with expression of (I) in a second normal brain tissue sample (R), where increased expression of (I) in (T) relative to (R), identifies (T) as likely to be neoplastic. Also described: (1) antibody that specifically binds to a extracellular epitope: (2) identifying (M3) a test compound as potential anticancer or antiglioma antibody that specifically binds to a extracellular epitope: (2) identifying (M3) a test compound with the cell which expresses drug involves contacting a test compound with the cell which expresses (I), monitoring an expression product of the at least one gene and identifying test compound a product of the at least one gene and identifying the test compound a protential anticancer or antiglioma drug involves contacting a test compound with the cell which expresses mRNA of the gene, and identifying the test compound as a potential anticancer drug if it compound with the cell which expresses mRNA of at least one gene, identifying the test compound as a potential anticancer drug if it compound with the cell which expresses mRNA of the gene, and identifying the test compound as a potential anticancer drug if it compound with the cell which expresses mRNA of a least one gene in mammal, a protein compound with the cell which expresses mRNA of a mammal, a protein compound with the cell which expresses mRNA of the gene, and can be used to trigger immune compound with the cell which is useful for inducing an immune mammal who has had estruction a glioma in a mammal having glioma or in a mammal who has had a glioma surgically removed. The present sequence represents a human of the compound which is used in the exergents in a mammal such compound in the exergical in the exergical in the exergic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
Diagnosing glioma by detecting expression product of any one of 255 genes, glioma endothelial markers, in brain tissue sample suspected of being neoplastic, and comparing the expression with expression in normal brain tissue sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ..

AAV02501-V02522, AAV02524-V02584, AAV02586-V02592 and AAV02594-V02616 are DNA fragments used in an assay to determine novel transcriptional activators. The method involves the production of transcriptional activators comprising of a DNA-binding group and a 6-25 amino acid peptide that is covalently bonded to the DNA binding group and does not represent a fragment of a natural transcription activator. Protein-crepresent a fragment of a natural transcription activator. Protein-crepresent a fragment of a natural transcription activator. Protein-crepresent a fragment of an actual transcription and a polypeptide containing aregion of Gal4 which therapet protein and a polypeptide containing a region of Gal4 which creases with Gall1P into a cell containing Gall1P and identifying members of the library that interact with the target from activation of transcription. Such constructs are used to activate transcription in a cell, e.g. for controlling gene activity, particularly in gene therapy (e.g. recognizing a site close to a selected therapeutic gene).

Transcription can be activated without blocking other transcriptional activators. They probably act by interacting with a component of the RNA polymerase II holoenzyme, Gall1, the strongest known yeast activator, which provides a more sensitive assay allowing detection of even weak protein-protein interactions. Such activators do not create toxicity
                                                                                                                                                                                                Activating sequence; Gal4; transcriptional activator; RNA polymerase;

the expression of a target nucleic acid (thA) sequence via binding of the compounds with the tha sequence. The method comprises generating a compounds with the tha sequence. The method comprises generating a library of virtual compounds in silico according to defined criteria, Also described are: (1) a method of a coording to defined criteria. Also described are: (1) a method of defining a set of oligomucleotides (ONS) that modulate the expression of a thA sequence via binding of the ONS with the thA sequence comprising criteria, and evaluating in silico the binding of the virtual ons with a correcting to defined criteria; and (2) a method of defined criteria; and evaluating in silico the binding of the virtual ONS with the thA according to defined criteria; and (2) a method of defining a set of compounds that the thA. The methods can be used for the generation criterion of synthetic compounds having defined physical, and identification of synthetic compounds having defined physical, chemical or bioactive properties. Information gathered from assays of tractable to a variety of nucleotide sequence-based technologies, e.g. antisense drug discovery and target validation. The present invention describes the human Zmax1 gene and the high bone mass (HBM) gene, which are found on chromosome 11q13.3. The Zmax1 and HBM gene, which are found on chromosome 11q13.3. The Zmax1 and HBM genes have osteopathic activities. The genes can be used in gene therapy, antisense therapy and in the production of vaccines. They can be used in the diagnosis and treatment of bone disorders including osteoporosis, Paget's disease, sclerostosis, osteoporosis, and fibrous dysplasia.

                                                                                                                                                                                                    Human G-alpha-11 phosphorothioate antisense oligonucleotide SEQ ID NO:70.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes inhibitory antisense compounds of 8-30 nucleotides, targeted to a nucleic acid molecule encoding human G-alpha-11. AAZ19468 to AAZ19547 represent human G-alpha-11 phosphorothioate antisense oligonucleotides given in the present invention. The oligonucleotides may be useful for the treatment of diseases associated with G-alpha-11
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; high bone mass; HBM gene; Zmaxl gene; chromosome 11; 11q13.3; sequence tagged site; STS; osteoporosis; osteopath; gene therapy; antisense therapy; vaccine; bone disorder; Paget's disease; adapter; acterostosis; osteomalacia; fibrous dysplasia; PCR primer; linker; ss.

                                            The invention relates to a method for identifying a molecule involved in lipid regulation comprising identifying a molecule that binds to or inhibits binding of a molecule to high bone mass (HBM) or its wild type can consider the compounds identified by the method are useful for treating, diagnosing, preventing or screening for normal and abnormal lipid—associated conditions, including arteriosclerosis, cardiovascular discoveration of diabetic atherosclerosis, neurovascular creatment or prevention of diabetic atherosclerosis, neurovascular conditions caused by plaque build-up, poor circulation due to plaque build-up, poor circulation due to plaque build-up, poor circulation due to plaque build-up and associated poor wound healing. The methods may be used in gene therapy, pharmaceutical development, and diagnostic assays for bone development disorders. Molecules identified by comparison of Zmax1 and HBM systems can be used as surrogate markers in pharmaceutical creatment of bone diseases. Sequences ABK22776-ABK23411 represent cDNA molecules encoding human Zmax1 and HBM, and PCR primers, probes, linkers and adapters of the invention
                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; high bone mass; HBM; LRP5; LRP6; transgenic; bone mass modulation; gene therapy; bone density modulation; bone strength; trabecular number; bone size; bone tissue connectivity; bone disease; osteoporosis; PCR; osteomalacia; rickets; Paget's disease; neoplasm of the bone; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New transgenic animals (e.g. mice), useful as models for studying bone density modulation, developing drugs for treating or preventing bone diseases (e.g. osteoporosis), or diagnosing diseases characterized by reduced bone density.

The invention relates to novel transgenic animals expressing the high bone mass (HBM) gene, expressing the corresponding wild type HBM gene, comprising an alteration of the gene encoding LRPS or LRPG, or expressing an LRPS that is modulated by an elected gene control sequence introduced by homologous or non-homologous recombination. The transgenic animals are for the study of bone density modulation or bone mass modulation. The invention may have a undergravity and cytostatic activity. The polynucleotides of the invention may have a use in gene therapy. The transgenic animals and nucleic acids are for the study of bone density modulation, where the bone mass is modulated relative to non-transgenic animals and composition are than one parameter selected from bone density, bone strength, trabecular number, bone size, or bone tissue connectivity. The transgenic animals, nucleic acids and methods are useful for identifying molecules involved in bone development, and for developing pharmaceutical compositions, which may be employed for treating or preventing bone diseases, e.g. osteoporosis, osteomalacia, rickets, Paget's disease, or neoplasms of the bone. The transgenic animals and nucleic acids are also useful in methods for diagnosing diseases involved in bone development, or characterised by reduced benefit or mass. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence tagged site #56 used to prepare map of Zmax1 (LRP5) gene region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New nucleic acid comprising a mutation in LRP5 or LRP6, useful for diagnosing a HBM-LIKe phenotype in a subject and for preparing a composition for modulating bone mass and/or lipid levels in a subject suffering from e.g. osteoporosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

             The present invention relates to High Bone Mass (HBM), LRPS (Zmax1) and LRPS mutants, which results in a HBM-like phenotype when expressed in a cell. The HBM-like phenotype results in bone mass modulation and/or lipid level modulation. The invention is useful for diagnosing a HBM-like phenotype in a subject and for preparing a composition for modulating benotype in a subject and for preparing a composition for modulating osteoporosis. The present sequence is a Sequence 1893ed Site (STS) marker, which was used to prepare a physical map of the Zmax1 (LRPS) gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  from an amino acid sequence appearing as ADR16922 or an amino acid sequence comprising or consisting of the extracellular domain of ADR16922 (amino acids 23-1385). ADR16922 is encoded by the HBM (high bone mass) allele of the human Zmax1 gene and has sequence similarity to LDL receptors. Also disclosed are nucleic acids, proteins, cloning vectors, expression vectors, transformed hosts, methods of developing pharmaceutical compositions, methods of identifying molecules involved in bone development, and methods of diagnosing and treating diseases and the high bone mass (HBM) allele on chromosome 11q13.3 encoding ADR16922. The protein is useful for treating, diagnosing, preventing, or screening for normal and abnormal conditions of bone, including metabolic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                osteopathic;

The invention relates to an isolated nucleic acid sequence encoding a high bone mass protein (HBM). The gene exists in two alleles, Zmax1, the notional wild-type (the cDNA for which appears as ADR47570 encoding ADR47571 and the HBM allele (the CDNA for which appears as ADR47571 coroding ADR47572) and the HBM allele differ by a single nucleotide encoding ADR47573. The two alleles differ by a single nucleotide of the protein of the protein. Also included are a replicative change at position 171 of the protein. Also included are a replicative change at position 171 of the protein. Also included are a replicative claning vector comprising HBM/Zmax1 (and a replicon operative in an expression vector comprising HBM/Zmax1 operably linked to a transcription regulatory region, an isolated host cell.

Ciansformed with the vector(8), a method for testing a substance as a transcription bone modulation, a method of identifying a molecule involved in bone modulation, a method of identifying a molecule involved in bone modulation, a method of testing for candidate) protein involved in bone modulation, a method of testing for disorder in an animal, a method of altering bone development in a host, a method for disagnostic screening cassay for bone development disorder, a disgnostic screening as partice protein to a bone development disorder, a disgnostic sassay for bone development disorder, a disgnostic sassay for bone development disorders.
                                                                                                                                      o;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acid sequence encoding high bone mass, useful in diagnosing,
bone diseases, e.g. osteoporosis. The present sequence is a PCR primer used in the mapping of the 2max1/HBM\ gene.
                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            bone development disorder; osteoporosis; chromosome 11; gene therapy;

                                                                      ઠ
                                                                                                                                                                 ö
artificial chromosome comprising HBM/Zmax1 sequence (appearing as ADR47584-ADR47580), a method for amplifying a nuclectide polymorphism in the Zmax1 or HBM gene, a method for identifying a regulatory element of a HBM gene and an isolated nucleic acid segment of at least 15 contiguous nuclectides including a polymorphic site from HBM/Zmax1. The nucleic acid molecule and the encoded polypeptide, composition, and methods are useful in diagnosting, treating and preventing a bone development disorder, i.e. osteoporosis. The gene for HBM/Zmax1 is located on chromosome 11q13.3.

The present sequence is a primer used in the mapping of the HBM/Zmax1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This synthetic olionucleotide can be used as a probe or PCR primer for the detection or amplification of a nucleic acid sequence encoding an epithelial protein (see AAW26546-51) that is useful in early cancer detection. It can also be used in methods for detecting epithelial protein mRNA in a biological sample. Such methods are important in detecting and differentiating precancer and cancer cells and normal cells and in detecting subsets of epithelial cells destined to become cancer cells. Diagnostic screens are claimed for lung, renal, breast or prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A new purified protein from epithelial cells - is expressed in high amounts in cancer and pre:cancer cells; used as a marker for diagnosis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This is the nucleotide sequence of a PCR primer used for amplification in the method of the invention. Probes and primers that hybridise to or amplify these peptides are used to diagnose precancerous states, e.g. of lung, liver, kidney, breast, prostate, head or neck, melanoma or myeloma, or to determine susceptibility to these conditions and for monitoring treatment. Precancer is also indicated by detecting post-translational modification of the epithelial peptide which is a marker of epithelial cell transformation. Antibodies are potentially useful for diagnosis and treatment of cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                οĘ

Human biallelic marker upstream amplification primer SEQ ID NO:6747

(first entry)

10-SEP-2001

Human genome, biallelic marker; high density disequilibrium map; genomic map; haplotype; phenotype; polymorphic base; genotyping; haplotyping; hybridisation; identification; characterisation; amplification; single nucleotide polymorphism; SNP; PCR primer;

diagnosis; ss Homo sapiens.

WO9954500-A2

28-OCT-1999

```
This sequence represents a primer used in the method of the invention for the detection of the presence or absence of chromosomal abnormalities, each abnormality being associated with a condition in a subject and each being defined by at least one characteristic nucleic acid sequence. The being defined by at least one characteristic nucleic acid sequence. The subject which may harbour one of the chromosomal abnormalities; (b) subjecting the sample to a multiplex molecular amplification (MMA) procedure, where a number of the characteristic sequences, if present in a sufficient amount, will be amplified; (c) retrieving the product(s) from step (b), and detecting the presence and/or absence or characteristic of the abnormal sequences to detect the presence or absence of corresponding chromosomal abnormalities; where the MMA procedure comprises the use of at least 7 mutually distinct primers (MDP) in one single reaction mixture, each of the primers defining an end of at least one characteristic nucleic acid sequence, and where at least one of the primers defines the first end of at least two characteristic nucleic acid sequences ach being determined in their opposite ends by MDP selected from the remainder of the MDP. The methods can be used for detecting chromosomal abnormalities
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      associated with diseases including numerous leukaemia's, lymphoma's, carcinoma's, adenocarcinoma's, sarcoma's, glioma's, neuroblastoma's, medullablastoma, malignant melanoma, and malignant neoplastic conditions

AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their mucleotide sequences. AAZ69579 to AAZ7740 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the

Novel biallelic markers used to construct a high density disequilibrium

The present invention relates to compositions and methods useful for the identification and detection of polycystic kidney disease (PKDI) gene mutations. The invention also relates to primers comprising a 5' region having a sequence that selectively hybridises to a PKDI gene sequence and optionally, to a PKDI homologue sequence and an adjacent 3' region having a sequence that selectively hybridises to a PKDI gene sequence and not to a PKDI homologue sequence. Primer pairs of the invention are useful for detecting the presence or absence of a mutation in a PKDI polynucleotide in a sample, for identifying a subject at risk for a PKDI-associated disorder such as autosomal dominant polycystic kidney disease (ADPKD) or acquired cystic disease and for diagnosing a PKDI-associated disorder in a subject. They are useful for selectively amplifying a region of a PKDI gene. PKDI DNA fragments are useful detecting the presence of a mutant PKDI polynucleotide in a sample, as a probe for an amplification contaction, in hybridisation or amplification and for engineering transgenic animals. The present sequence is a PCR primer used to detect mutation in
                                                                                                                                                                                                                                                                                                                                                          Novel primer for diagnosing polycystic kidney disease-associated disorder, comprises regions having sequence that selectively hybridizes to polycystic kidney disease gene sequence.

Detecting tumor-derived or -associated RNA in the bodily fluids, usefu. for diagnosing cancer or monitoring response to anticancer therapy, by detecting e.g. epidermal growth factor RNA, EGR receptor or her-2/neu

Disclosure; Page 16; 46pp; English.

The invention relates to a novel method for detecting tumour-derived or tumour-associated RNA in the plasma or serum fraction of blood, or in a body fluid, from a human or animal. The method comprises detecting an amplified product produced from the tumour-derived or tumour-associated RNA or converse or tumour-associated RNA or converse or tumour-associated RNA or converse or factor (EGF) RNA, her-2/neu RNA, converse or receptor (EGF) RNA, her-2/neu RNA, converse or receptor (EGF) RNA, her-2/neu RNA, converse or screening an animal, particularly a human, for method is useful for screening an animal, particularly a human, for constitution or between the production and second animal or human, for the converse or converse or second the second the second the second the second to a sloo useful for selecting an animal or human with cancer the cancer disapposite or for monitoring response to anticancer therapy. The method is sepecially useful for detecting, diagnosing, monitoring, or evaluating proliferative disorders, e.g. premalignancy, cancer, non-invasive cancer, carcinoma-in-situ, invasive cancer, metastatic cancer, advanced cancer or benign nooplasm. The present cancer, sequence is used in the exemplification of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a double-stranded short interfering nucleic acid (siNA) that downregulates expression of the vascular endothelial growth factor receptor (VEGFR) gene. Also described: (1) a siNA that downregulates the VEGF gene. (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; (4) vectors that express siNA; and (5) single-stranded siNA with similar properties. On that annological, antiarthritic, antipsoriatic, nephrotropic and convinties. The siNA are useful for modulating of gynaecological activities. The siNA are useful for modulating a wide range of angiogenesis-associated conditions, particularly cancers, diabetic retinopathy, macular degeneration, particularly cancers, diabetic retinopathy, macular degeneration, and polycystic kidney disease. The siNA may also be useful for diagnosis, and polycystic kidney disease. The siNA may also be useful for diagnosis, drug screening, target identification and validation, genetic conditions, and polycystic kidney disease. The siNA may also be useful for diagnosis, drug screening, studying gene function, and also for gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence is used in the exemplification of the present invention.

The present invention describes a double-stranded short interfering nucleic acid (siMa) that downregulates expression of the vascular endothelial growth factor receptor (VEGFR) gene. Also described: (1) a siNA that downregulates the VEGF gene, (2) kits for in vitro or in vivo or in vivo or sina, and (5) single-stranded siNA with similar properties. The siNAs have antianglogenic, cytostatic, antidiabetic, opthalmological, antiarthritic, antipsoriatic, nephrotroppic and crivities. The siNA are useful for modulating (downregulating) the expression of VEGFR genes. The sina are potentially useful for treating a wide range of angiogenesis-associated conditions, particularly cancers, diabetic retinopathy, macular degeneration neovascular glaucoma, arthritis, psoriasis, endometriosis, angiotibroma, and polycystic kidney disease. The siNA may also be useful for diagnosis, diapering, studying gene function, and also for gene mapping (e.g. of engineering, studying gene function, and also for gene mapping (e.g. of single-inclostide polymorphisms). The present sequence is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                             short interfering nucleic acid; siNA;
protein tyrosine phosphatase type IV; PRL3; RNA interference; cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel short interfering nucleic acid (siNA) that downregulates expression of a protein tyrosine phosphatase type IV (PRL3) gene by RNA interference. The invention further relates to modulating the expression of PRL3 genes in cells, tissue explants or organisms by the introduction of an siNA, kits for in vitro or in vivo delivery of an siNA, conjugates and/or complexes of siNA, and vectors that express siNA. The novel siNA's of the invention have cyrostatic activity. siNA's are used to modulate expression of PRL3 genes, in cells, tissue explants or organisms, e.g. for treating cancer but also for drug screening, diagnosis, target identification and validation; genetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               engineering; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). This polymouteleotide sequence represents a short interfering nucleic acid for downregulating the expression of a protein tyrosine phosphatase type IV (FRL3) gene of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Protein tyrosine phosphatase type IV (PRL3) gene siNA, SEQ ID No 116.
                                                                                                                                                                                                                                                                                                                                                        short interfering nucleic acid, useful e.g. for treatment and gnosis of cancer, downregulates expression of a protein tyrosine
                        Protein tyrosine phosphatase type IV (PRL3) gene siNA, SEQ ID No 42.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

short interfering nucleic acid; siNA; protein tyrosine phosphatase type IV; PRL3; RNA interference; cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel short interfering nucleic acid (siNA) that downregulates expression of a protein tyrosine phosphatase type IV (PRL3) gene by RNA interference. The invention further relates to modulating the expression of PRL3 genes in cells, tissue explants or organisms by the introduction of an siNA; kits for in vitro or in vivo delivery of an siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The novel siNA's of the invention have cytostatic activity. SiNA's are used to modulate expression of PRL3 genes, in cells, tissue explants or organisms, e.g. for treating cancer but also for drug screening; diagnosis; target identification and validation; genetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     engineering; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). This polymucleotide sequence represents a short interfering nucleic acid for downregulating the expression of a protein tyrosine phosphatase type IV (FRL3) gene of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            antilipemic; cardiant; vasotropic; antiarteriosclerotic; antidiabetic; cytostatic; anticonvulsant; nootropic; muscula; anti-HIV; RNA interference; iRNA; antisense technology; lipid metabolism; cholesterol imbalance; dyslipidaemia hypercholesterolaemia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates expression of a protein tyrosine phosphatase type IVa gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

Interference RNA agent useful for treating dyslipidemias, coronary artery disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications.

Example 5; SEQ ID NO 2657; 378pp; English.

The invention describes a RNA interference (iRNA) agent (I) comprising a sense sequence and an antisense sequence, where the sense sequences have one or more asymmetrical 2'-O alkyl modifications, the antisense sequence and an antisense sequence, where the sense sequence and an antisense sequence targets a human gene sequence. Also described and the antisense sequence targets a human gene sequence. Also described are: a pharmaccutical preparation comprising (I); reducing (MI) apoB-100 levels or glucose-6-phosphatase levels in a subject; producing (II); anyolves selecting a sequence with activity and introducing one or more asymmetrical modification in the sequence, where the modification decreases nuclease sensitivity while not decreasing its activity; a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition comprising (I). Il is cuseful for reducing apoB-100 levels or glucose-6-phosphatase levels.

Consectuation decreases or administer or organization comprising (I). Il is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.

Conterwise unwanted expression of apoB-100, elevated or otherwise unwanted expression of apoB-100, elevated or otherwise unwanted classification from a disorder content to a subject to disorder is chosen from the HDL/LDL cholesterol imbalance, dyslipidaemia, coronary artery disease (CAD), coronary heart classase (CHD) and atherosclerosis. (I) is administered to a subject to continity the patic glucose production or for treating glucose-metabolism.

Creating the diseases as mentioned above, cancer (e.g. breast, colon or treating the diseases as mentioned above, cancer (e.g. breast, colon or culming the diseases as mentioned above, cancer (e.g. breast, colon or control ApoB gene expression.

ö
introducing one or more asymmetrical modification in the sequence, where the modification decreases nuclease sensitivity while not decreasing its activity, a kit comprising (I) and instruction for its use, and a device that can be dispense or administer a composition comprising (I). (I) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. The subject is suffering from a disorder characterised by elevated or otherwise unwanted expression of apoB-100, elevated or otherwise unwanted apoB-100 layous apoB-100, elevated or otherwise unwanted disorder, and/or disregulation of lipid metabolism. The disorder is chosen from the HDL/LDL cholesterol imbalance,
                                                                                                                                                                                                                                                                                                                                                                  dyslipidaemias, hypercholestorolaemia, statin-resistant hypercholesterolaemia, coronary artery disease (CAD), coronary heart disease (CHD) and atherosclerosis. (I) is administered to a subject to inhibit hepatic glucose production or for treating glucose-metabolism-related disorder e.g. diabetes or type-2 diabetes. (I) is useful for treating the diseases as mentioned above, cancer (e.g. breast, colon or lung cancer), neurological disease (e.g., buttington disease or spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence represents a human apolipoprotein B (ApoB) antisense oligonucleotide that can be used to control ApoB gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cytostatic; anticonvulsant; nootropic; muscula; anti-HIV; MNA interference; iRNA; antisense technology; lipid metabolism; cholesterol imbalance; dyslipidaemia hypercholesterolaemia; coronary attery disease; CAD; coronary heart disease; CHD; atherosclerosis; hepatic glucose production; glucose-metabolism-related disorder; disease; huntington disease; spinocencer; lung cancer; neurological disease; Huntington disease; spinocerebellar ataxia; viral disease; AIDS; apolipoprotein B; apoB; ss.

The invention describes a RNA interference (IRNA) agent (I) comprising a sense sequence and an antisense sequence, where the sense sequences have one or more asymmetrical phosphorothicate modifications can enter antisense sequence targets a human gene sequence. Also described and the antisense sequence targets a human gene sequence. Also described and the antisense sequence targets a human gene sequence. Also described care: a pharmaceutical preparation comprising (I); reducing (MI) apoB-100 levels or glucose-c-phosphatase levels in a subject; producing (I); involves selecting a sequence with activity and correspond one or more asymmetrical modification in the sequence, where the modification decreases nuclease sensitivity while not decreasing its activity; a kit comprising (I) and instruction for its use; and adevice the modification decreases nuclease sensitivity while not decreasing its activity; a kit comprising (I) and instruction for its use; and adevice the modification decreases nuclease sensitivity while not decreasing its cativity; a kit comprising (I) and instruction for its use; and adevice that can be dispense or administer a composition comprising (I). (I) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (MI) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (MI) is useful for otherwise unwanted expression of apoB-100, elevated or otherwise unwanted disorder is chosen from the HDL/LDL cholesterol imbalance, disease (CHD) and atherosclerosis. (I) is administered to a subject to inhibit hepatic glucose production or for treating the diseases as mentioned above, cancer (e.g. breast, colon or treating the diseases as mentioned above, cancer (e.g. breast, colon or cultural disease (e.g., Huntington disease or spinocerebellar ataxia) or viral disease (e.g., Huntington disease or spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence con the page or produced or subject or spinocerebellar by the disease (e.g., Huntington disease or spinocerebellar
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                             Interference RNA agent useful for treating dyslipidemias, coronary artery disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                antilipemic, cardiant, vasotropic, antiarteriosclerotic, antidiabetic,

The invertion describes a kan interference (irka) agent (i) comprising a sequence and an antisense sequence, where the sense sequences have one or more asymmetrical phosphorothicate modifications and the antisense sequence targets a human gene sequence. Also described are: a pharmaceutical preparation comprising (i); reducing (MI) app8-100 levels or glucose-6-phosphatase levels in a subject; producing (I); stabilising (I); involves selecting a sequence with activity and introducing one or more asymmetrical modification in the sequence, where the modification decreases nuclease sensitivity while not decreasing its crivity; a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition comprising (I). (I) is useful for reducing apo8-100 levels or glucose-6-phosphatase levels. The subject is suffering from a disorder characterised by elevated or otherwise unwanted expression of apo8-100, elevated or otherwise unwanted corpression of apo8-100, elevated or otherwise unwanted disorder is chosen from the HDL/DL cholesterol imbalance, dyslipidaemias, hypercholestorolaemia, statin-resistant the pactic glucose production or for treating glucose-metabolism-related disorder e.g. diabetes or type-2 diabetes. (I) is useful for inhibit hepatic glucose as mentioned above, cancer (e.g. breast, colon or lung cancer), neurological disease (e.g., Hundington disease or spinocreabellar ataxia) or viral disease (e.g., Albab) antisense oligonucleotide that Interference RNA agent useful for treating dyslipidemias, coronary artery disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications. The invention describes a RNA interference (iRNA) agent (I) comprising 0.7%; Score 14.4; DB 1; Length 19; 93.8%; Pred. No. 2.1e+02; tive 0; Mismatches 1; Indels Sequence 19 BP; 4 A; 5 C; 5 G; 5 T; 0 U; 0 Other; can be used to control ApoB gene expression. useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. The subject is suffering from a disorder characterised by elevated or cherwise unwanted expression of agoob-100, elevated or otherwise unwanted expression of agoob-100, elevated or otherwise unwanted levels of cholesterol, and/or disregulation of lipid metabolism. The disorder is chosen from the HDL/LDL cholesterol imbalance, dyslipidaemias, hypercholestorolaemia, statin-resistant hypercholesterolaemia, coronary artery disease (CAD), coronary heart hypercholesterolaemia, coronary artery disease (CAD), coronary heart hypercholesterolaemia, coronary artery disease (CAD), coronary heart calated disorder e.g. diabetes or treating glucose-metabolism-related disorder e.g. diabetes or treating plucose-metabolism treating the diseases as mentioned above, cancer (e.g. breast, colon or coronary artaxia) or viral disease (e.g., Muntington disease or spinocerebellar ataxia) or viral disease (e.g., AlDS). This sequence represents a human apolipoprotein B (ApoB) antisense oligonucleotide that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     antilipemic; cardiant; vasotropic; antiarteriosclerotic; antidiabetic; cytostatic; anticonvulsant; nootropic; muscula; anti-HIV; RNA interference; iRNA; antisense technology; lipid metabolism; cholesterol imbalance; dyslipidaemia hypercholesterolaemia; coronary artery disease; CAD; coronary heart disease; CHD; atherosclerosis; hepatic glucose production; glucose-metabolism-related disorder; diabetes; cancer; breast cancer; spinocancer; lung cancer; neurological disease; Huntington disease; spinocerebellar ataxia; viral disease; AIDS; apolipoprotein B; apoB; ss.

The invention describes a RNA interference (IRNA) agent (I) comprising a sense sequence and an antisense sequence, where the sense sequences have conserved an antisense sequence, where the sense sequences have conserved and an antisense sequence. The antisense conserved are sequence as a human gene sequence. Also described and the antisense sequence targets a human gene sequence. Also described are: a pharmaceutical preparation comprising (I); reducing (MI) apoB-100 (19vels or glucose-6-phosphatase levels in a subject; producing (II); catabilising (I), involves selecting a sequence with activity and introducing one or more asymmetrical modification in the sequence, where the modification decreases nuclease sensitivity while not decreasing its activity; a kit comprising (I) and instruction for its use; and a device (C that can be dispense or administer a composition comprising (I). (I) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (The subject is suffering from a disorder characterised by elevated or otherwise unwanted expression of apoB-100, elevated or otherwise unwanted constraing apoB-100 levels or glucose-6-phosphatase levels. (The subject is suffering from a disorder characterised by elevated or otherwise unwanted expression of apoB-100, elevated or otherwise unwanted constraing apoB-100 levels or glucose-6-phosphatase levels. (C disease (CHD) and atherbolestorolaemia, statin-resistant (C disease (CHD) and atherosclerosis. (I) is administered to a subject to inhibit hepatic glucose production or for treating glucose-metabolism-created diseases as mentioned above, cancer (e.g. breast, colon or cureating the diseases as mentioned above, cancer (e.g. breast, colon or color or conserved (e.g., ADS). This sequence conserved in a phosperion or for treating glucoses and mentioned above, cancer (e.g., breast, colon or conserved (e.g., ADS). This sequence conserved and application or for treating glucoses or conserved in a phosperioned above, cancer (e.g., brease or conserved in a publicat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The invention describes a RNA interference (IRNA) agent (I) comprising a sense sequence and an antisense sequence, where the sense sequences have one or more asymmetrical phosphorothicate modifications equences have one or more asymmetrical phosphorothicate modifications and the antisense sequence targets a human gene sequence. Also described are: a pharmaceutical proparation comprising (I); reducing (MI) apoB-100 levels or glucose-6-phosphatase levels in a subject; producing (I); involves selecting a sequence with activity and introducing one or more asymmetrical modification in the sequence, where the modification decreases nuclease sensitivity while not decreasing its activity; a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition (I). (I) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.

The subject is suffering from a disorder characterised by elevated or cherwise unwanted expression of apoB-100, elevated or otherwise unwanted corposertion of lipid metabolism. The disorder is chosen from the BID/IDL cholestean implance, dyslipidaemias, hypercholestorolaemia, statin-resistant corpus of disease (CAD), coronary heart of disease (CAD) and atherosclerosis. (I) is administered to a subject to inhibit hepatic glucose production or for treating glucose-metabolism. The inhibit hepatic glucose production or for treating glucose-metabolism. The inhibit hepatic glucose sementationed above, cancer (e.g. breast, colon or human cancer (e.g. breast or colon or human cancer (e.g. breast, colon or human cancer (e.g. breast or colon or human cancer (e.g. breast or colon or human cancer (e.g. breast or cancer or ca

that can be dispense or administer a composition comprising (I). (I) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. The subject is suffering from a disorder characterised by elevated or otherwise unwanted expression of apoB-100, elevated or otherwise unwanted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention describes a RNA interference (iRNA) agent (I) comprising a sense sequence and an antisense sequence, where the sense sequences have one or more asymmetrical 2.0 alkyl modifications, the antisense sequence sequence targets a human gene sequence. Also described are: a pharmaceutical preparation comprising (I); reducing (MI) apoB-100 levels or glucose-6-phosphatase levels in a subject; producing (I); stabilising (I), involves selecting a sequence with activity and introducing one or more asymmetrical modification in the sequence, where the modification decreases nuclease sensitivity while not decreasing its activity; a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition comprising (I).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Interference RNA agent useful for treating dyslipidemias, coronary disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example 5; SEQ ID NO 3035; 378pp; English

levels of cholesterol, and/or disregulation of lipid metabolism. The disorder is chosen from the HDL/LDL cholesterol imbalance, dyslipideamias, hypercholestorolaemia, statin-ressistant hypercholesterolaemia, coronary artery disease (CAD), coronary heart disease (CHD) and atherosclerosis. (I) is administered to a subject to inhibit hepatic glucose production or for treating glucose-metabolism-related disorder e.g. diabetes or type-2 diabetes. (I) is useful for treating the diseases as mentioned above, cancer (e.g. breast, colon or lung cancer), neurological disease (e.g., Huntington disease or spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence represents a human apolipoporcian B (ApoB) antisense oligomucleotide that can be used to control ApoB gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   virus (PRRSV) is new. New DNA sequences comprise a 15424 or 15113 pp sequence (isolates ISU-12 and ISU-55, respectively, (given in the specification). The DNA sequences are designated as SEQ ID No. (ISU-12) and SEQ ID No. (ISU-55). INDEPENDENT CLAIMS are also included for the following: a DNA sequence encoding an open reading frame (ORF) of PRRSV 51120-12 or ISU-52 or ISU-52 as above; a polypeptide encoded by a DNA sequence as above; a composition for inducing antibodies against PRRSV comprising one or more polypeptides of (1); and distinguishing PRRSV strain ISU-55 from other strains of PRRSV by: amplifying a DNA sequence of the PRRSV using primers (55F) and (3RPLP); digesting the amplified sequence with Drai, and correlating the presence of 3 restriction fragments of 626, 187 and 135 bp with a PRRSV ISU-55 strain: S'-CGTACGGCGATAGGGACACC-3' (55F) 5'-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Porcine Reproductive and Respiratory Syndrome Virus (PRRSV) DNA sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DNA sequences encoding a porcine reproductive and respiratory syndrome

cc specification). The DNA sequences are designated as SEQ ID No. (ISU-12) and SEQ ID No. (ISU-55). INDEPENDENT CLAIMS are also included for the following: a DNA sequence encoding an open reading frame (ORF) of PRRSV ISU-55 as above; a polypeptide encoded by a DNA sequence as above; a polypeptide encoded by a DNA sequence as above; a composition for inducing antibodies against PRRSV comprising one or more polypeptides of (1); and distinguishing PRRSV comprising one or enter strains of PRRSV by: amplifying a DNA sequence of the PRRSV using prince (SES) and (STRIP); digesting the amplified sequence of the PRRSV ISU-55 strain. 5'-CGTAGGCGATAGGGACACC-3' (STRIP); digesting the amplified sequence of 13 restriction fragments of 6.26, 187 and 135 bp with a PRRSV ISU-55 strain. 5'-CGTAGGCGATAGGGACACC-3' (STRIP) Also disclosed are polypeptide sequences of ORFs 2-5 of ISU-12 and ISU-55. These sequence comprise 256, 254, 178 and 200 amino acids, respective (DRF) (both isolates have identical length oppoptides encoded by the respective ORFs). Preferred Sequences. The CRFs (1) and 2-7) of PRRSV ISU-55 strain. 5'-CGTAGGCGATAGGGACACC-3' (STRIP) Also disclosed are polypeptide sequences. The CRFs (1) and 14578-1494 of the 15424 bp sequence. The ORFs (11, 1b and 2-7) of PRRSV ISU-55 comprise nucleotides 191-769, 7687-12069, 12074-1244, comprise nucleotides against PRRSV effective to induce the can be administered orally or parentally, intravenously, intraperitoneally, intransuscularly, or parentally, Administration may be captaged to p

Contractions and portione reproductive and respiratory syndrome to three sequences encoding a portione reproductive and 15424 or 15113 bp sequences (isolates 180-12 and 180-5, respectively, given in the sequence as the sequence are designated as SEQ ID No. (180-12) and SEQ ID No. (180-5). INDEPENDENT CLAIMS are also included for the collowing; a DNA sequence encoding an open reading frame (ORF) of FRRSV (1801-12) and SEQ ID No. (180-5) as above; a polypeptide encoded by a DNA sequence as above; a composition for inducing antibodies against PRRSV comprising one or more polypeptides of (1); and distriguishing PRRSV strain ISU-55 from corner strains of PRRSV by; amplifying a DNA sequence of the PRRSV using corners of PRRSV by; amplifying a DNA sequence of the PRRSV using corners and correlating the presence of 3 restriction fragments of 626, 187 and correlating the presence of 3 restriction fragments of 626, 187 and correlating the presence of 3 restriction fragments of 626, 187 and 200 amino acids, respectively (both isolates have identical length and 200 amino acids, respectively (both isolates have identical length and 200 amino acids, respectively (both isolates have identical length and 200 amino acids, respectively (both isolates have identical length and 2-7) of PRRSV 150-12 comprise mucleotides 191-7387, 7387, 7385 (14, 1b and 2-7) of PRRSV 150-12 comprise mucleotides 191-7387, 1369-1436, of the 15424 by sequence. The ORFS (1a, 1b and 2-7) of PRRSV 150-1369-1436, 131-137-14077, intradementally intraperitonemally contransmally, intradementally and principal intraperitonemally or intransmally, intradementally and principal intransmally, intradementally and principal intransmally, intradementally and principal intransmally. The land 160-55 polypeptides and be used to induce antibodies against PRSV effective to induce antibodies and as vaccines to protect pigs from a portine reproductive and content or protect pigs from a portine reproductive or induce antibodies in pigs. The lung lesson is a pvalue less than 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                       Porcine Reproductive and Respiratory Syndrome Virus (PRRSV) DNA sequences
                                                                                                                                                     DNA sequences encoding a porcine reproductive and respiratory syndrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        porcine reproductive and respiratory syndrome virus; PRRSV; antiviral;

```
Amethod has been developed for the identification of a nucleic acid
capable of modulating a process in a biological system. The method
capable of modulating a process in a biological system. The method
acid catalysts (NAC) having a substrate binding domain (SBD), comprising
acid catalysts (NAC) having a substrate binding domain (SBD), comprising
a random sequence, and a catalytic domain (CD); and (b) identifying NBC
in systems where modulation has occurred and/or determining the sequence
of at least part of the SBDs in such systems. Nucleic acid molecules with
catomouchease activity and catalytic activity, from the present invention,
are used to modulate gene expression in plant and mammalian cells and to
caused by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepstic
ascites and infection. They may also be used to detect genetic drift and
mutations in diseased calls and to determine of the Raf gene, are
used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or
generally any condition associated with the level of c-raf. Introduction
of sugar/phosphate modifications increases stability against nuclease and
cativity. Any09022 to AAV93877 represent NACS that can be used in the
method, specifically for modulating the expression of a Raf gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ô

The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the coligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, retinoblastoma, BRCA1, BRCA2, CFTK, cyclin-dependent kinase inhibitor 2A (CDKNZA), APC, Factor VIII, Factor IX, haemoglobin alpha locus (CDKNZA), hemoglobin alpha locus 2 (HBA2), MEA1, MSH2, MSH6, apolipoprotein E (APOE), IDL receptor (IDLR), UDP-glucuronosyltransferase (UGTI), amyloid precursor protein (APC), presentila-1 (PSENI) and presentila-2 (PSENI2). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, haemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia, various syndromes. The present sequence is one of the gene correcting oligonucleotides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The present invention provides single-stranded oligonucleotides which can oble used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, retinoblastoma, BRCA1, BRCA2, CFRR, cyclin-dependent kinase inhibitor 2A (CDKNA3A, APC, Factor V, Factor VIII, Factor IX, haemoglobin alpha locus apolioporatein (APOB). LDL receptor (LILRA), haemoglobin alpha locus apolioporatein (APOB). LDL receptor (LILRA), psyclucuronosyltransferase (UGT1), amyloid precursor protein (APC), presenilin-1 (PSENI) and presenilin-2 (PSENI). These can be used in the gene therapy of diseases
                                                                                                                                                         Human; gene therapy; adenosine deaminase deficiency; p53; beta-globin; retinoblastoma; BRCA1; BRCA2, CFTR; cystic fibrosis; cancer; Factor V; cyclin-dependent kinase inhibitor 2A; CDKN2A; melanoma; APC; HBA1; HBA2; adenomatous polyposis of the colon; Factor VII; Factor IX; thrombosis; haemophilia; alpha thalassaemia; haemoglobin alpha locus 1; MLH1; APOB; mismatch repair; MSH2; MSH6; hyperlipidaemia; apolipoprotein E; LDLR; familial hypercholesterolasmia; MCT1; syndrome, APP; PSEN1; antisense; UDP-glucuronosyltransferase; amyloid precursor protein; presentlin-1; Alzheimer's disease; cytostatic; antisickling; antianaemic; haemostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Oligonuclectide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  buch as cancer, adenosine deaminase deficiency, cystic fibrosis, haemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia, Alzheimer's disease, melanoma, adenomatous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

be used for the targeted alteration of genomic sequences, where the coligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, cetinoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A (CDRA7A), APC, Factor V, Factor VIII, Factor IX, haemoglobin alpha locus (CDRA7A), APC, Factor VIII, Factor IX, haemoglobin alpha locus (CDRA7), APC, MSH6, apolipoprotein E (APOR), LDL receptor (LDLR), UDP-glucuronosyltransferase (UGT1), amyloid precursor protein (APC), presenilin-1 (PSEN1) and presenilin-2 (PSEN2). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, haemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia, arious syndromes. The present sequence is one of the gene correcting oligonucleotides of the invention
The present invention provides single-stranded oligonucleotides which can

```
The present invention provides single-stranded oligonuclectides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, cretinoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A (CDKNZA), APC, Factor V, Factor VII, Factor IX, haemoglobin alpha locus 1 (HBA1), haemoglobin alpha locus 2 (HBA2), MLH1, MSH2, MSH6, apolioporotein E (APOS), LDL receptor (LDLR), UDP-glucronosyltransferase (UGT1) amyloid precursor protein (APC), presentlin-1 (PSEN1) and precursor protein (APC), presentlin-1 (PSEN1) and cancer, adenosine deaminase deficiency, cystic fibrosis, happercholesterolesmia, thalassaemia, sickle cell anaemia, harious syndromas, adenomatous polyposis of the colon and Alzheimer's disease, melanoma, adenomatous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;

The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatis; in mocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least three of the 5 terminal nucleotides and a 3 and anddification of a 3 '-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, maningNik, neurologic infection, hepatis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, least the 2'-O-methyl modifications, phosphorothioate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The invention relates to nucleic acid molecules that modulate replication of the West Nile (WAV). The nucleic acid molecules are useful for treating a condition related to WAV infection e.g. pancreatitis, enclated to wave intensity in the constitution of molecule is selected from the group of ribozymes consisting of Mammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least the 2'-O-methyl modifications, phosphorothicate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given molecule of the invention
                                                                                                                                                                                                                                                                                                      New nucleic acid molecule that modulates replication of West Nile Virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                        (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatis, in mocarditis, meningitis, neurologic infection, hepatis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, least ten 2'-O-methyl modifications, phosphorothioate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                   New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WNV; West Nile Virus; antiinflammatory; cytostatic; hepatotropic; virucide; neuroprotective; antibacterial; replication; pancreatitis; encephalitis; myocarditis; meningitis; infection; hepatitis; liver failure; cancer; cirrhosis; Hammerhead; Inozyme; DNAzyme; Amberzyme; Zinzyme; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (NNV). The nucleic acid molecules are useful for treating a condition related to MVV infection e.g. pancreatitis, mocarditis, methodiscondiction, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least trace of the 5' terminal nuclecides and a 3' end modification of a 3'-3' inverted abasic molety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed, however, SEQ ID NO 2194-2206 and 17502-17514 are not given molecule of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                        New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least the 2'-O-methyl modifications, phosphorothioate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
